Assay

Principle

The assay is based on the increase in absorbance at 340 nm as the formation of NADPH proceeds in the following reactions:

ATP: Adenosine triphosphate
 NADP: Nicotinate adenine dinucleotide phosphate
 G6PDH II : Glucose -6 -phosphate dehydrogenase

Unit definition

One unit is defined as the amount of enzyme which generates 1 μ mole of NADPH per minute at 37°C under the conditions specified in the assay procedure.

■ Enzyme solution

Accurately weigh about 20 mg of the sample and add enzyme dilution buffer to make a total of 20 ml. Dilute it with enzyme dilution buffer to adjust the concentration as required.

■ Procedure

1. Pipette accurately 3.0 ml of reaction mixture into a small test tube and preincubate at 37°C.
2. After 5 min, add exactly 50 μ l of enzyme solution and mix to start the reaction at 37°C.
※ In the case of a test blank, add 50 μ l of enzyme dilution buffer in place of enzyme solution.
3. After starting the reaction, measure the rate of increase per minute in absorbance at 340 nm. The rate must be measured within the linear portion of the absorbance curve.

Absorbance sample :As/min

blank :Ab/min

$\Delta A/\text{min} = (\text{As}/\text{min} - \text{Ab}/\text{min}) \leq 0.030 \text{ Abs}/\text{min}$

■ Calculation

$$\text{Activity (U/mg of powder)} = \frac{\Delta A/\text{min}}{6.22} \times \frac{3.05}{0.05} \times \frac{1}{X}$$

6.22 : millimolar extinction coefficient of NADPH at 340 nm
($\text{cm}^2 / \mu\text{mole}$)

3.05 : final volume (ml)

0.05 : volume of enzyme solution (ml)

X : concentration of the sample in enzyme solution
(mg/ml)

Storage

Storage at -20°C in the presence of a desiccant is recommended.
